Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

//note="Organ: mixed (see below); Vector: pT7T3D-Pac
(Pharmacia) with a modified polylinker; Site_1: Not I;
Site_2: ECO RI: Equal amounts of plasmid DNA_from three
normalized libraries (melanocyte 2NbHW, pregnant uterus
NBHPU, and fetal heart NBH19W) were mixed, and ss circles
were made in vitro. Following HAP purification, this DNA
was used as tracer in a subtractive hybridization
reaction. The driver was PCR-amplified cDNAs from pools of
5,000 clones made from the same 3 libraries. The pools
consisted of I.M.A.G.E. clones 260232-265223,
34048B-345479, and 48448B-489479."

profiles into the pUC 18 vector. Reverse transcription of
tissue mRNA and cDNA amplification were performed under
low stringency conditions.

Cablo 1274, UN. E-meal. enquiries: numquery esanger.ac.uk clonerequestes: clonerequestes assembly data is compared from overlapping clones. During sequence assembly data is compared from overlapping clones. Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with mis sequence was finished as follows unless otherwise noted: all regions were either double-stranded or sequenced with an alternate chemistry or covered by high quality data (i.e., phred quality >- 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by at least one plasmid subclone or more than one M13 subclone; and the assembly was confirmed by restriction digest. The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases: Em. EMBE; Sw. SWISSPROT; Tr., TREMBL; WP., WORMPEP; Information on the WORMPEP database can be found at http://www.sanger.ac.uk/Projects/C_elegans/wormpep This sequence was generated from part of bacterial clone contigs of human chromosome 9, constructed by the Sanger Centre Chromosome 9 mapping betto.
   PRI 01-JUN-2001
   AL353685 129608 bp DNA linear PRI 01-JUN-200:
Human DNA sequence from clone RP11-31J20 on chromosome 9, complete
  Eukaryota, Metazoa, Chordata, Cranlata, Vertebrata, Buteleostomi,
Mammalia, Eutheria, Primates, Catarrhini, Hominidae, Homo.
   http://www.sanger.ac.uk/HGP/Chr9
RP11-31J20 is from the library RPCI-11.1 constructed by the group
of Pieter de Jong. For further details see
  IMPORTANT: This sequence is not the entire insert of clone RP11-31J20 It may be shorter because we sequence overlapping sections only once, except for a 100 base overlap. The true right end of clone RP11-31J20 is at 129608 in this sequence. The true right end of clone RP11-413C10 is at 2000 in

Homo sapiens clone RP11-1M10, WORKING DRAFT SEQUENCE, 39 unordered
  Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi;
Mammalla; Eutheria; Primates; Catarrhini; Hominidae; Homo.
   Submitted (21-007-1999) Whitehead Institute/MIT Center for Genome Research, 320 Charles Street, Cambridge, MA 02141, USA on Apr 22, 2000 this sequence version replaced gi:6454033.
  Center: Whitehead Institute/ MIT Center for Genome Research
   NOTE: This is a 'working draft' sequence. It currently consists of 39 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will
  Sequencing vector: M13; M77815; 100% of reads
Sequencing vector: M13; M77815; 100% of reads
Chemistry: Dye-terminator Big Dye; 100% of reads
Assembly program: Phrap; version 0.960731
Consensus quality: 117571 bases at least Q40
Consensus quality: 117571 bases at least Q30
Consensus quality: 160940 bases at least Q20
Insert size: 185000; agarose-fp
Insert size: 171264; sum-of-contigs
Quality coverage: 2.9 in Q20 bases; sum-of-contigs

Ferreira, P., Fitzhugh, W., Forrest, C., Gage, D., Galagan, J., Gardyna, S., Grant, G., Hagos, B., Heaford, A., Horton, L., Howland, J.C., Johnson, R., Jones, C., Kannt, L., Karatas, A., Klein, J., Landers, T., Lehoczky, J., Levine, R., Lieu, C., Liu, G., Locke, K., Macdonald, P., Marquis, N., McEwan, P., McGurk, A., McKernan, K., McMertan, P., Morrow, J., Naylor, J., Naylor, J., Naylor, J., Naylor, J., Naylor, J., Naylor, J., Naylor, J., Naterens, R., McMentan, C., Pierre, M., Pisani, C., Polneal, P., Olivar, T.M., Peterson, K., Pisani, C., Polneal, P., Olivar, T.M., Peterson, K., Stojanovic, N., Subramanian, A., Talamas, J., Tesfaye, R., Theodore, J., Tirrell, A., Vassiliev, H., Viel, R., Vo, A., Wu, X., Wyman, D., Ye, W.J., Tirrell, A., Vassiliev, H., Viel, R., Vo, A., Wu, X., Wyman, D., Ye, W.J., Zimmer, A. and Zody, M.

Jirect Submission

All repeats were identified using Repeatmasker:
Smit, A.F.A. & Green, P. (1996-1997)
Smit, A.F.A. & Green, P. (1996-1997)
  Center: Whitehead Institute/ MIT Center for Genome Research Center code: WIBR
  arbitrary. Low-pass sequence sampling is useful for identifying clones that may be gene-rich and allows overlap relationships among clones to be deduced. However, it should not be assumed that this clone will be sequenced to completion. In the event that the record is updated, the accession number will
  sequencing reads that have not been assembled into contigs. Runs of N are used to separate the reads and the order in which they appear is completely

Center: Whitehead Institute/ MIT Center for Genome Research
  NOTE: This is a 'working draft' sequence. It currently consists of 10 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
  Insert size: 2055000; agarose-fp

  selection: chloramphenicol NEIGHDRIA SEQUENCE INFORMATION: NEIGHDRIA SEQUENCE INFORMATION: The clone sequenced to the left is RP5-866N18, 200 bp overlap; clone sequenced to the right is CTA-343P13, 200 bp overlap. The actual start is unknown, the first known base of overlap is at base position 139224 of RG114A06; actual end is at 53881 of CTA-343P13. Location/Qualifiers
   The sequence of this clone was established as part of a mapping and sequencing collaboration between the NHGRI Chromosome 7 Mapping project (Eric D. Green, Director), John D. McPherson in the Department of Genetics (Washington University), and the Washington University Genome Sequencing Center. For additional information about the map position of this sequence, see http://www.nhgri.nih.gov/DIR/GTB/CHR7, send mailto:egreen@hhgri.nih.gov , or see http://genome.wustl.edu/gsc
   Submitted (10-JUL-1999) Department of Genetics, Washington University, 4444 Forest Park Avenue, St. Louis, Missouri 63108, USA (bases 1 to 18427)
  Direct Submission
Submitted (21-DEC-1999) Department of Genetics, Washington
Missouri 41.4 Errors Park Avenue. St. Louis, Missouri 63108, USA
  JUNIALITIES (UI-MAY-1999) Department of Genetics, Washington University, 4444 Forest Park Avenue, St. Louis, Missouri 63108, USA (c. bases 1 to 18427)
  Submitted (24-MAR-1999) Genome Sequencing Center, Washington
University School of Medicine, 4444 Forest Park Parkway, St. Louis,
MO 63108, USA
   NOTICE: This sequence may not represent the entire insert of this clone. It may be shorter because we only sequence overlapping clone sections once, or longer because we provide a small overlap between neighboring data submissions.
   all regions were double stranded, sequenced with an alternate chemistry, or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by sequence from more than one subclone; and the assembly was confirmed by
  This clone is from the first BAC library from Genome Systems, Inc. (http://www.genomesystems.com).
Cell line: lymphoblastoid
Haplotypes: two

Direct Submission

Librated (09-0CT-2000) Sanger Centre, Hinxton, Cambridgeshire,

CB10 1SA, UK. E-mail enquiries: hunquery@sanger.ac.uk Clone
requests: clonerequest@sanger.ac.uk

On Aug 21, 2000 this sequence version replaced gi:9856693.

During sequence assembly data is compared from overlapping clones.

Where differences are found these are annotated as variations
together with a note of the overlapping clone name. Note that the
variation annotation may not be found in the sequence submission
corresponding to the overlapping clone, as we submit sequences with
This sequence has been finished according to sequence map criteria
as follows. An attempt is made to resolve all sequencing problems,
annotated human repeats but not necessarily within known
sequence is ambiguous, there is an annotation using the 'unsure'
   ó
  Human DNA sequence from clone RP11-5N23 on chromosome 10p14-15.3 Contains ESTs, GSSs, STSs and a CpG island. Contains the 5' part of the PRKCQ gene for protein kinase C theta and a novel gene,
  PRI 12-OCT-2000
  The following abbreviations are used to associate primary accession
  IMPORTANT: This sequence is not the entire insert of clone RP11-5N23 It may be shorter because we sequence overlapping sections only once, except for a 100 base overlap.

The true right end of clone RP11-5N23 is at 132741 in this sequence. The true left end of clone RP11-55478 is at 102011 in this sequence. The true right end of clone RP11-55478 is at 100 in
  http://www.sanger.ac.urk/HGP/Chri0
RP11-5N23 is from the library RPCI-11.1 constructed at the Roswell
Park Cancer Institute by the group of Pieter de Jong. For further
details see http://bacpac.med.buffalo.edu/
  Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi;
Mammalia; Eutheria; Primates; Catarrhini; Hominidae; Homo.

Human ABC1 genomic DNA.

```
The invention relates to the human ABCI cholesterol transporter protein CC (888082) and to nucleic acid sequences (C69120) which encode it. ABCI is a member of the ATP-binding cassette (ABC transporter) superfamily of proteins, and plays a crucial role in cholesterol transport, particularly citracellular cholesterol trafficking in monocytes and fibroblasts, being involved in cholesterol trafficking in monocytes and fibroblasts, being involved in cholesterol lefflux from the cell. The gene encoding ABCI is coracted on chromosome 9431, and mutations in this gene are associated involved in cholesterol efflux from the cell. The gene encoding ABCI is with two genetic HDL (high density lipoprotein) deficiency discases. CT angler disease (TD) and familial HDL deficiency (FHA). These diseases of an autosomal dominant trait. LOW levels of HDL ("good cholesterol") in the blood correlate with a high risk of cardiovascular disease, particularly corromary artery disease, but also cerebrovascular disease, coronary restenosis, and peripheral vascular disease. Coronary restenosis, and peripheral vascular disease. Coronary restenosis, and peripheral vascular disease. Cardiovascular disease. The invention provides genetic constructs and transgenic cells and mon-human animals comprising human ABCI nucleic cardiovascular disease comprising the administration of an expression coronary are an activity, compounds which minic ABCI expression and methods of sorteening for such compounds coronary cerebrovascular disease, coronary restenosis or peripheral vascular disease, Huntingcon's disease, "Viliked adrenoleukodystrophy and cerebrovascular disease, Huntingenome as GenBank Acce
  New ABC1 polypeptide is useful for treating diseases associated with ABC1 biological activity, e.g. Alzheimer's disease, Huntington's

diagnosed as having a lower than normal high density.

Lipoprotein-cholesterol (HDL-C) level, a higher than normal triglyceride level, or a cardiovascular disease, involving administering a compound that modulates LXR- or RXR-mediated transcriptional activity or ABC1 expression or activity.

The LXR gene product may be used in an assay to identify compounds useful for the treatment of a disease or condition selected a lower than normal HDL cholesterol level, a higher than normal triglyceride level, and a cardiovascular disease.
  Treating a lower than normal high density lipoprotein-cholesterol (HDL-C) level, a higher than normal triglyceride level, or a cardiovascular disease, by administering a compound that modulates LXR-or RXR-mediated transcriptional activity .

The present sequence encodes a human adenosine triphosphate (ATP)

binding cassette protein (ABC) 1 polypeptide. ABC1 resides in cell

comembranes and utilises ATP hydrolysis to transport a wide variety of
substrates across the plasma membrane. ABC1 is a pivotal protein in

the apolipoprotein-mediated mobilisation of intracellular cholesterol

stores. ABC1 is defective in Tangler disease, a genetic disorder

characterised by abnormal HDL-cholesterol metabolism. The ABC1 gene is

cocalised to chromosome 9422-9431. The ABC1 genes and proteins are

useful for developing pharmaceutical agents for the treatment of heart

ciseal of other disorders associated with hypercholesterolemia and

therosclerosis. The genes are useful for developing screening assays

creen for compounds that regulate the expression of genes associated

with cholesterol transport. The genes and proteins are also useful for

are also useful as diagnostic indicators of cardiovascular disease and

cother disorders associated with hypercholesterolemia.

Human; cytokine; cell proliferation; cell differentiation; growth factor;
  Naudin L;
   The sequence represents the partial coding sequence of human ABC1, which encodes amino acids 1-60 of the human ABC1 protein. The nucleic acid sequence, primers and probes derived from the ABC1 sequence, and polypeptides and vectors are useful for the prevention of atherosclerosis, in a subject affected by a dysfunction in the reverse transport of coholesterol. The polypeptide encoded by the ABC1 gene is useful for screening for an active ingredient for the prevention or treatment of a disease resulting from dysfunction in the reverse transport of coholesterol. The nucleic acids and polypeptides are also

Sequences ABB10981-ABB12330 represent 1350 novel human polypeptides, and sequences ABA08225-ABA09574 represent nucleic acids encoding them. The invention also relates to vectors and recombinant host cells comprising a nucleotide of the invention, methods of producing the novel polypeptides. Concleotide of the invention allowed of detecting the nucleotides or polypeptides of the invention and methods of identifying compounds which bind to polypeptides of the invention. Although novel, many of the polypeptides of the invention have homology to known proteins, thereby giving an insight into their probable biological activities, and hence potential therapeutic applications. The polypeptides of the invention may concentrate activities, and hence to potential therapeutic applications. The polypeptides of the invention may have various activities; stem cell growth factor activity; has receptor or information activities; concentration activities; concentration activities; concentration activities; on may be nead to activities; concentration are useful for preventing, treating or metastasis.

Conditions e.g., by protein or gene therapy. Such conditions include cancers, haematopotatic disorders (e.g., metopotatic activities and nucleotides of the invention are useful for preventing, treating or ameliorating medical carreial ischemma, bone disorders (e.g., metopotatic), athonic inflammatory conditions (e.g., asthma or arthritis), proliferative retinopathy, atherosclerosis, coronary heart disease, arterial ischemma, bone disorders (e.g., metoporosis), and abnormal cracial schemma, bone disorders (e.g., metoporosis), and abnormal cracial inflammatory activities may be used to promote wound to muniopulatory activities may be used in the treatment of viral, munnomodulatory activities may be used in the treatment of viral, channed to promote cell growth factor activity may be used in cell culture to an individual properties the nealing (e.g., of burns, incisions and ulocars), while those with growth factor activity may be used
  autoimmune disease or accidental damage. The polypeptides and nucleotides may also be used in the diagnosis of the above conditions, and in drug screening techniques. The present sequence represents a cDNA encoding a novel human polypeptide of the invention.

Human; ATP binding cassette transporter 1; ABC1; coronary heart disease;
   The invention relates to four common polymorphisms in the gene encoding APP-binding cassette transporter-1 (ABC1). ABC1 is associated with decreased AppA-1 mediated efflux of cholesterol. The polymorphisms in ABC1 directly affects cellular lipid homeostasis, which is a key factor in the atherogenetic processes. The ABC1 polymorphisms are useful for diagnosing and treating lipid disorders, cardiovascular diseases (coronary heart disease, atherosclerosis) and inflammatory diseases (psortasis, lupus erythematosus). The identification of ABC1 as a transporter for interleukin-lbeta (IL-lbeta) identifies this gene as a candidate for treatment of inflammatory diseases including rheumatoid

The present sequence is that of cDNA encoding the human adenosine triphosphate (ATP) binding cassette transporter 1 (ABC1) protein (see AMM5027). The sequence includes an extended open reading frame (ORF) to that provided by the sequence in AAT70314, using an alternative ATG codon as initiation codon and thereby adding an extra 40 Nterminal amino acids to the encoded ABC1 protein (see AMM50228). The invention provides 4 common polymorphisms in the ABC1 gene. These were identified by sequencing the ABC1 gene in different Tangier kindreds. In the variant genes (numbering as in alternation 136, A is changed to G at position 5589 or G is changed to C at position 136, A is changed to G at position 2589 or G is changed to C at position 3456, or any combination of these. All of these polymorphisms alter the amino acid sequence of ABC1 and therefore may affect its function. The 2 most common polymorphisms (G596A) and A2589G are both associated with a decreased in vitro ApoA-I mediated efflux of cholesterol from mononuclear phagocytes, a cature typical of Tangier disease. 3 of the variants (G596A, A2589G and G3456C) are significantly increased in a population of manding low high density lipoprotein cholesterol lower.

```
The invention relates to the human ABC1 cholesterol transporter protein (B38082) and to nucleic acid sequences (C69120) which encode it. ABC1 is a member of the ATP-binding cassette (ABC transporter) superfamily of proteins, and plays a crucial role in cholesterol transport, particularly intracellular cholesterol trafficking in monocytes and fibroblasts, being involved in cholesterol efflux from the cell. The gene encoding ABC1 is notly two genetic HDL (high density lipoprotein) deficiency disorders, with two genetic HDL (high density lipoprotein) deficiency disorders, with two genetic HDL (high density lipoprotein) deficiency disorders, are distinguishable in that TD is an autosomal recessive disorder, while FHA is inherited as an autosomal dominant trait. Low levels of HDL ("good cholesterol") in the blood correlate with a high risk of cardiovascular disease, coronary restenosis, and peripheral vascular disease.

Conversely, a high level of HDL has protective effects against cardiovascular disease. The invention provides genetic constructs and

New ABC1 polypeptide is useful for treating diseases associated with ABC1 biological activity, e.g. Alzheimer's disease, Huntington's disease and cancer -

Examples; Page -; 229pp; English.

The invention relates to the human ABC1 cholesterol transporter protein

(B38082) and to nucleic acid sequences (C69120) which encode it. ABC1 is
a member of the ATP-binding cassette (ABC transporter) superfamily of
proteins, and plays a crucial role in cholesterol transport, particularly
intracellular cholesterol trafficking in monocytes and fibroblasts, being
cocated on cholesterol trafficking in monocytes and fibroblasts, being
involved in rohlesterol efflux from the cell. The gene encoding ABC1 is
cocated on chromosome 9931, and mutations in this gene are associated
with two genetic HDL (high density lipoprotein) deficiency disorders,
are distinguishable in that TD is an autosomal recessive disorder, while
FHA is inherited as an autosomal dominant trait. Low levels of HDL ("good
closesterol") in the blood correlate with a high risk of cardiovascular
disease, particularly coronary artery disease, but also cerebrovascular
disease, coronary restenosis, and peripheral vascular disease.
Conversely, a high level of HDL has protective effects against
cardiovascular disease. The invention provides genetic constructs and
transconic collises. cerebrovascular disease, coronary restenosis or peripheral vascular disease. They may also be used in the treatment of diseases associated with ABCI biological activity, such as Alzheimer's disease, Niemann-Pick disease, Huntington's disease, X-linked adrenoleukodystrophy and cancer. The invention specifically excludes proteins with the exact amino acid sequences of GenBank Accession No: CAA10005.1 and X75926, and the nucleic acid with the exact sequence as GenBank Accession No: AJ012376.1. The transgenic cells and non-luman animals comprising human ABC1 nucleic acids, and methods of gene therapy for the treatment or prevention of cardiovascular disease comprising the administration of an expression vector encoding ABC1 or an active fragment thereof. The invention also encompasses compounds which mimic ABC1 activity, compounds which stimulate ABC1 expression and methods of screening for such compounds. It further relates to methods for determining whether a patient has an increased risk for cardiovascular disease due to polymorphisms in the ABC1 gene. Human ABC1 proteins and nucleotides can be used to treat or prevent cardiovascular disease, especially coronary artery disease,

The sequence represents the coding sequence #1 of human ABC1. The nucleic acid sequence, primers and probes derived from the ABC1 sequence, and polypeptides and vectors are useful for the prevention of atherosclerosis, in a subject affected by a dystunction in the reverse transport of cholesterol. The polypeptide encoded by the ABC1 gene is useful for screening for an active ingredient for the prevention or treatment of a disease resulting from dysfunction in the reverse transport of cholesterol. The nucleic acids and polypeptides are also useful for treating and preventing cardiovascular and neurological pathologies, and other diseases e.g. Tangyler disease, lecithin-cholesterol (LCAT) deficiency, malaria and diabetes.

   The present sequence is that of genomic DNA encoding novel human conversity lipoprotein binding protein 2 (LBP-2, see AAB82806).

The DNA was isolated from a human genomic library by screening with LBP-2 DNA (see AAH82494). The open reading frame spans 5 exons. Human LBP-2 nucleic acids are among claimed polynucleotides of the invention that encode novel polypeptides, termed LBPs, capable of inding to native and methylated LDL. Also claimed are isolated LBP propeptides, and biologically active fragments and analogues of them, as well as expression vectors, cells and methods of producing the LBPs. Methods of determining if an animal is at risk or atherosclerosis, methods for treating an agent for use in abnormality in structure or metabolism of LBP are claimed.

The properties of the methods for treating a cell having an abnormality in structure or metabolism of LBP are claimed.

The present sequence represents a PCR primer for the 5' upstream gene sequence including the exon 1 through exon 3 regions of human bone corphogenetic protein 4 (BMP-4). This region of DNA and a reporter gene morphogenetic protein 4 (BMP-4). This region of DNA and a reporter gene weight compounds which regulate the expression of human BMP-4. The low cartivity and inhibiting activity for bone and cartiales through the extression of human BMP-4, and are useful as preventative or therapeutic expression of human BMP-4, and are useful as preventative or therapeutic expression of human BMP-4, and are useful as preventative or therapeutic genetic for cartialge and bone diseases, and osteohyperplasia, and as remedies for osteometastasis. The compounds are also useful in the fields of orthopaedic surgery (fracture, osteoarthritis such as joint and hip joint osteoarthritis, atthrostelis, danage of cartilage such as damage of meniscus, regeneration of bone and cartilage deficit caused by injury and tumour dissection, bone reconstruction such as spinal compounds way also be used for bone graft in aesthetic surgery. The compounds also have application in the veterinary field. Those compounds that inhibit bone or cartilage morphogenesis are used for prevention and the rarrian and cartilage morphogenesis.

This invention relates to a promoter or transcriptional initiation
region of a plant genome that is capable of modifying gene expression
during plant material senescence. Plant senescence is the sequence of
during plant material senescence. Plant senescence is the sequence of
blochemical and physiological events comprising the final stage of plant
development. The promoter or a DNA construct containing the promoter is
useful for modifying gene expression during senescence, for delaying
senescence characteristics, and for modifying the expression of strong
also be used for the expression of antisense or senes protease sequences,
delaying fruit ripening, enhancing senescence characteristics of plant
material, modifying expression of at least 1 plant growth regulator, for
transforming plant material with a transgene under the control of the
promoter, for modifying expression of a protease inhibitor, pesticidal
ce promoter, for modifying expression of a protease inhibitor, pesticidal
content and DNA construct are also useful for producting a plant
material having modified gene expression during senescence for enhancing
the expression of pesticidal compounds during senescence, and for
the expression of pesticidal compounds during senescence, and for
the expression of metanishing the promoter or a construct and plant material with
the promoter or a construct are also useful for producing a plant
material having modified gene expression during senescence, and for
the expression of pesticidal compounds during senescence, and for
the expression or a construct are also useful for producing a plant
the normander or a construct and plant material with
   the promoter or a construct containing it. The present sequence represents a second variant of DNA from the promoter region upstream of the senescence-enhanced See2a gene isolated from Zea mays. This sequence
   modification of gene expression during senescence of plant material and for modifying expression of protease inhibitors and pesticidal genes -

  The present sequence represents a human bone morphogenetic protein-4 promoter (BMP-4) region 1. The invention provides a method for the identification of therapeutic agents for use in the prevention and/or treatment of osteoporosis. The method involves introducing two expression vectors into a host cell. The first expression vector comprises of a BMP-4 promoter region 1 or 2 (AAV32784) which is operably intended to a reporter gene, e.g. BMP-4 gene. The second expression vector comprises of a DNA encoding an estrogen receptor. The host cell is then contacted with the compounds being being tested for therapeutic activity. Compounds which bind and form a complex with the estrogen receptor, to gain entry into the cell, and then induce the expression of the reporter gene, through the BMP-4 promoter region, are potential therapeutic candidates. By this method, the antitumour agent ICII64384 was shown to be an effective therapeutic agent. Unlike oestrogens currently used to treat osteoporosis, the therapeutic agents are claimed not to have an increment in the risk of developing breast or endometrial

mammal. The method comprises administering a bone morphogenetic protein in combination with a vitamin D compound, where: (a) the bone morphogenetic protein is BMP-2 and is administered in an amount of 500-1000 ng in combination with about 6 ng vitamin D compound; or (b) the bone morphogenetic protein is BMP-4 and is administered in an amount of about 62.5 ng in combination with about 6 ng vitamin D compound; or (b) the present sequence encodes BMP-4. The method is used for treating bone defects or disorders, e.g. fractures, surgical lesions, periodontal disease, osteoporosis, arthritis and rickets.

The sequences given in Anious Line number of CBMP3. These proteins, CBMP2B, CBMP2A and the partial sequence of CBMP3. These proteins have true osteogenic activity when properly folded and dimerised. CBMP2B and CBMP2A may form a heterodimer with mature hop-1. These proteins contain a conserved six or seven cysteine skeleton in their active regions. Probes based on this region have been used in the solution of further osteogenic protein family members. Fragments of these proteins can be used in the production of dimeric peptides which may be used in the generation of antibodies with binding specificities for osteogenic proteins. The antibodies with binding specificities for osteogenic proteins. The antibodies with binding specificities of proteins of the osteogenic protein and may be used in purification protocols. Osteogenic proteins, such as these, may be used in an implantable osteogenic device which allows predictable bone in an implantable osteogenic device which allows predictable bone formation correct acquired and congenital cranôferial and other skeletal or dental anomalies. They may be used to induce local endochrondral bone formation in non-union fractures and in other clinical applications including dental and periodontal applications including dental and periodontal applications including central and periodontal applications including central and periodontal applications where bone formation is required. Other potential applications include cartilage repair, e.g. in the treatment of osteoarthritis. This sequence was repair, e.g. in the breatment of osteoarthrities.

The present sequence encodes a human osteogenic protein, which is used in the present invention. The present invention describes methods for selectively extracting an osteogenic protein (OP) from a mixture. The method comprises: (a) exposing the mixture to an antibody that specifically binds OP, separating the resulting antibody-protein complex from the mixture, and dissociating the complex. In the methods OP comprises a pair of oxidised subunits that are disulphide-bonded to form a dimer, and one of the subunits has an amino acid (aa) sequence designated OPS, sequence given in the specification. In dimeric form OP is capable of inducing cartilage and endochondral bone formation in a mammal when disposed within a matrix implanted in the mammal. The

The invention relates to a device for implantation in a mammal comprising a chondrogenic protein (1) dispersed within a biocompatible, in vivo degradable matrix defining pores which permits the influx, prolliferation and differentiation of migratory progenitor cells, where (1) comprises a substantially pure protein with the amino acid sequence VPKPCCAPT, which is capable of inducing cartilage formation. The device is used as an allogenic or xenogenic implant for the induction endochondral bone formation in mammals.

  polypeptide (II) sequences. (I) is useful as hybridisation probes, polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical
mammalian cells, able to induce bone and cartilage formation; (F) mature opt secreted from mammalian cells following expression of the sequence that encodes horl-PP; and (G) production of an active osteogenic composition by truncating mature opt protein. Host cells of (C) are used to produce proteins able to induce cartilage and bone formation, e.g. for correction of acquired or congenital craniofacial defects or other skeletal or dental disorders; to heal non-union fractures; to repair cartilage, e.g. in osteoarthritis, or generally wherever bone formation is required. The proteins induce complete development of endochondral bone, including vascularisation, mineralisation and bone marrow differentiation. The present sequence encodes human CBMP2B.

The HindIII-SacI bovine genomic bBMP-2 fragment described in AAN80627 is subcloned into M13, labelled and used as probe to screen bolyadenylated RNAs from various cells and tissue sources. Sequence analysis of the weakly hybridising recombinants hBMP-2 class II (=BMP-4) indicated that they are quite homologous with the sequence given in AAN80622 at the end of their coding regions, but less so in
   This cDNA sequence encodes the human bone morphogenic protein (BMP) 2B. Oligonucleotide probes were synthesised based on a partially sequenced BMP-2B protein isolated from ground bowine powder. The probes were used to screen a bowine liver DNA library to obtain the BMP-2B encoding DNA sequence. The DNA was used to screen a U-2 OS human cell line cDNA library to obtain this human BMP-2B cDNA. BMPs can be used to induce bone and cartilage formation, and in wound healing and tissue repair. They can also be used for treating periodontal disease or osteoporosis.

  The sequence was obtd. from clone lambda U2OS-3 (ATCC 40342) which was isolated from a cDNA library prepd. using human cell line U-2 OS RNA. It is one of two classes of clones isolated distinguished by hybridisation characteristics. This class, designated hBMP-2B (previously BMP-4 and BMP-2 Class II) hybridised only weakly with the probe which was derived from the bovine BMP-2A sequence, and showed only partial homology with that sequence. The second class, hBMP-2A (previously BMP-2 and BMP-2 class I) hybridised strongly and was much more homologous. The gene prod. is an oseteoinductive protein useful for inducing bone/cartilage repair, wound healing and tissue repair. Typical applications include healing of
      Human cDNA hBMP-2 class II contains an opem reading frame of 1224 bp, encoding a protein of 408 amino acids. The protein is preceded by a 5' untranslated region of 394 bp with stop codons in all frames, and contains a 3' untranslate dregion of 308 bp following the in-frame stop codon. The 8 bp region preceding this 5' untranslated region represents a linker used in the cDNA cloning procedures. See also AAN80619-N80636 and AAN81963-64.

Patent No. 6204434

GENERAL INFORMATION:

APPLICANT: Bloksberg, Leonard N.

APPLICANT: Bloksberg, Leonard N.

TITLE OF INVENTION: Materials and Methods for the

TITLE OF INVENTION: Modification of Plant Lignin Content;

TITLE REFERENCE: 11000.1003c31

CURRENT APPLICATION NUMBER: US/09/211,710A

CURRENT FILING DATE: 1998-12-14

NUMBER OF SEQ ID NOS: 15

(http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with THA DNA polymerase and THA polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gelectrophoresis. Vector DNA was prepared from a derivative of pMDA2 (gil4722114|gb|AF129072.1), a copy-number inducible derivative of plasmid Rl. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XLLO-Gold (Stratagene) cells and selected for ampicillin resistance."
  Theorem 1 (bases 1 to 515)

q δ

```
(http://www.jax.orgyrescources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with 74 DNA polymerase and 74 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pwD42 (qilq/32114|qb)AR129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

   δ
  (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWD42 (qil4732114) [plART29072.1], a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for amplicillin resistance."

ORIGIN
  (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high monar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWD42 (qil4732114 qib1AR129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coll XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

  Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

B Direct Submission

Submitted (11-74N-2002) Wellcome Trust Sanger Institute, Hinxton, Cambridgeshire, CBIO 1SA, UK. E-mail enquiries:

humquery@sanger.ac.uk Clone requests: clonerequest@sanger.ac.uk

on Jan 15, 2002 this sequence version replaced gi:18121468.

During sequence assembly data is compared from overlapping clones where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission only a small overlap as described above.

This sequence was finished as follows unless otherwise noted: all regions were either double-stranded or sequenced with an alternate chemistry or covered by high quality data (1-e., phred quality >-30); an attempt was made to resolve all sequencing problems, such one plasmid subclone or more than one M13 subclone; and the assembly was confirmed by restriction digest. The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases: Em:, EMBL; Sw:, SWISSPROT; Tr:, TREMBL; WP:, WORNEPP; Information on the WORNEPP. http://www.sanger.ac.uk/Projects/C\_elegans/wormpep This sequence was generated from part of bacterial clone contigs of human chromosome 9, constructed by the Sanger Centre Chromosome 9 Mapping Group. Further information can be found at http://www.sanger.ac.uk/HGP/Chr9
RP11-217B7 is from the library RPCI-11.1 constructed by the group

```
sections only once, except for a short overlap.

The true right end of clone RPI1-217B7 is at 96717 in this sequence. The true left end of clone RPI1-122F10 is at 72980 in this sequence. The true right end of clone RPI1-132F10 is at 2000 in this sequence.

H., O'Connor, T., O'Donnell, P., Peterson, K., Pollaray, N., Stojanovic, N., Subramanian, A., Talamas, J., Tesfaye, S., Tirrell, A., Vassillev, H., Vo, A., Wheeler, J., Wu, X., Wyman, D., Ye, W. J., Zimmer, A. and Zody, M.
  Submitted (21-OCT-1999) Whitehead Institute/MIT Center for Genome Research, 320 Charles Street, Cambridge, MA 02141, USA On Apr 22, 2000 this sequence version replaced 91:6434033. All repeats were identified using RepeatMasker:
Smit, A.F.A. & Green, P. (1996-1997) http://ftp.genome.washington.edu/RM/RepeatMasker.html
  Center: Whitehead Institute/ MIT Center for Genome Research
  NOTE: This is a 'working draft' sequence. It currently consists of 39 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
  Mammalia; Euthería; Primates; Catarrhini; Hominidae; Homo.
  Center project name: L2510

Center clone name: L2510

Center clone name: 1_M_10

Center clone name: 1_M_10

Center clone name: 1_M_10

Center clone name: 1_M_10

Consencing vector: M13, M77815; 100% of reads

Assembly program: Phrap; version 0.960731

Consensus quality: 145749 bases at least Q40

Consensus quality: 145749 bases at least Q20

Consensus quality: 160940 bases at least Q20

Insert size: 185000; agarose-fp

Insert size: 171264; sum-of-contigs

Quality coverage: 2.9 in Q20 bases; sum-of-contigs

arbitrary. Low-pass sequence sampling is useful for identifying clones that may be gene-rich and allows overlap relationships among clones to be deduced.
  However, it should not be assumed that this clone will be sequenced to completion. In the event that the record is updated, the accession number will
contigs. Runs of N are used to separate the reads and the order in which they appear is completely

All repeats were identified using RepeatMasker:
Smit, A.F.A. & Green, P. (1996-1997)
http://ftp.genome.washington.edu/RM/RepeatMasker.html ..... Genome Center Center: Whitehead Institute/ MIT Center for Genome Research NOTE: This record contains 92 individual sequencing reads that have not been assembled into contigs. Runs of N are used to separate the reads and the order in which they appear is completely arbitrary. Low-pass sequence sampling is useful for identifying clones that may be gene-rich and allows overlap relationships among clones to be deduced. However, it should not be assumed that this clone will be sequenced to completion. In the event that Center code: WIBR Web site: http://www-seq.wi.mit.edu Contact: sequence\_submissions@genome.wi.mit.edu the record is updated, the accession number will 911 1010: gap of 100 bp 1011 1873: contig of 863 bp in length 1874 1973: gap of 100 bp 910: contig of 910 bp in length Project Information Center project name: L4483 Center clone name: 24\_J\_9 be preserved.    Submitted (30-MAR-2000) Whitehead Institute/MIT Center for Genome Research, 320 Charles Street, Cambridge, MA 02141, USA On May 25, 2000 this sequence version replaced gi:7637299.
   Center: Whitehead Institute/ MIT Center for Genome Research
  NOTE: This is a 'working draft' sequence. It currently consists of 16 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
   Assembly program: Phrap; version 0.960731

AC097253 228703 bp DNA linear HTG 20-DEC-2001 Rattus norvegicus chromosome SA clone CH230-152G15, WORKING DRAFT SEQUENCE, 12 unordered pieces.
   Submitted (23-0CT-1999) Production Sequencing Facility, DOE Joint Genome Institute, 2800 Mitchell Drive, Walnut Creek, CA 94598, USA On Aug 31, 2000 this sequence version replaced gi:7690207.
Sequence Quality Assessment:
This entry has been annotated with sequence quality estimates computed by the Phrap assembly program.
All manually edited bases have been reduced to quality zero. Quality levels above 40 are expected to have less than 1 error in 10,000 bp.
  Base-by-base quality values are not generally visible from the GenBank flat file format but are available as part of this entry's ASN.1 file.
  Base-by-base quality values are not generally visible from the GenBank flat file format but are available as part of this entry's ASN.1 file.
  This entry has been annotated with sequence quality estimates computed by the Phrap assembly program. All manually edited bases have been reduced to quality zero. Quality levels above 40 are expected to have less than 1 error in 10,000 bp.
   Gaps
  * NOTE: This is a 'working draft' sequence. It currently consists of 7 contigs. Gaps between the contigs are represented as runs of N. The order of the pieces is believed to be correct as given, however the sizes of the gaps between them are based on estimates that have provided by the submittor.

* This sequence will be replaced
